Dear Candidates,

As part of the evaluation process, you are required to complete the following technical assignment.

Please read the **complete assignment and the provided Excel file carefully** before starting the implementation.

Technical Assignment: AI Agent Workflow Automation

Objective

You will be provided with an **Excel file containing 10 business workflows**.

Your task is to convert these workflows into **AI agents that can understand a user's request, identify the appropriate workflow, execute the required steps, handle conditions/errors, and return the final result**.

Requirements

For each of the 10 workflows:

1. Read and understand the workflow from the Excel file.
2. Identify:
 - Input
 - Required steps
 - Tools/APIs required
 - Conditions/decisions
 - Expected output
3. Convert the workflow into an executable agent/workflow.
4. The agent should be able to:
 - Understand the user's request
 - Select the correct workflow
 - Execute the required steps
 - Handle conditions and errors
 - Return the final result
5. The system should clearly show:

- Which workflow was selected
- What steps were executed
- The final output

Expected Architecture

Important Architecture Requirement

Do NOT build 10 separate hard-coded chatbots.

Build a **reusable and scalable agent/workflow architecture** where adding an **11th workflow requires minimal code changes**.

We will specifically evaluate your approach to:

- Reusability
- Scalability
- Maintainability
- Workflow selection
- Agent reasoning
- Tool execution
- Error/condition handling

Example

User Request

"Check today's inventory and identify products that need restocking."

Expected System Behavior

Selected Workflow:
Inventory Restock

Steps Executed:
1. Fetch inventory
2. Check stock threshold
3. Identify products
4. Generate restock list

Result:
Products requiring restocking:
...

Technical Requirements

Use:

- Python
- LLM
- Agent / Tool Calling
- Excel as the workflow source
- API/tool simulation where real APIs are unavailable

You may use:

- LangGraph
- LangChain
- OpenAI Agents SDK
- Or another suitable agent/workflow framework

You are free to choose the architecture and tools, but you should be able to explain and justify your technical decisions.

Submission Requirements

Your submission will consist of **ONLY TWO LINKS**:

GitHub Repository

Submit **one GitHub repository link**.

Everything required for evaluation must be available inside the GitHub repository, including:

- Source code
- Excel workflow file/data
- README
- Setup and installation instructions
- All 10 implemented workflows
- Example inputs/requests
- Outputs/results
- Configuration or sample environment file, if required
- Any other files required to run and evaluate the project

Do not send the Excel file, code ZIP, README, or other files separately. Everything should be properly organized inside the GitHub repository.

Loom Video

Submit **one Loom video link** demonstrating and explaining your completed solution.

The Loom should cover:

- Overall architecture
- How the Excel workflows are processed
- How the correct workflow is identified
- How the agent executes the workflow
- Tool/API calling
- Conditions and error handling
- Working examples
- How your architecture can support an **11th workflow**
- Important technical decisions

Please demonstrate the **actual working application** during the Loom video.

Read Carefully Before Starting

Please carefully review **every requirement in this assignment and every workflow provided in the Excel file**.

We are evaluating not only coding ability, but also your ability to:

- Understand detailed requirements
- Correctly interpret business workflows
- Follow instructions
- Identify conditions and dependencies
- Build a reusable architecture
- Test your implementation
- Explain your own technical decisions

You may use AI tools such as ChatGPT, Claude, Gemini, or coding assistants during development. However, you are expected to **understand, validate, test, and be able to explain the complete solution yourself**.

Do not submit an AI-generated solution without properly reviewing and testing it against all 10 workflows.

DEADLINE

please complete the task and submit on or before 3pm Thursday.

Your submission must contain:

GitHub Link + Loom Link

Incomplete submissions will be rejected and will not be considered for the next stage.

Please make sure the GitHub repository is accessible and contains everything required to evaluate and run the project before submitting the links.

Regards,

Poonam Thakur
